

UIPATH AGENTHACK 2026

Edgion Atlas turns scattered physical-risk signals into a review case file.

Specialist agents prepare the review package. UiPath routes the case and records the decision.

Agents prepare. UiPath governs. Humans decide.

Edgion Ltd | UK physical-risk intelligence | edgion.co.uk

PROBLEM

Thames Valley DC-01 entered review with a credible flood signal and missing resilience evidence.

Sample review case for award demo. Not a client asset.

- Portfolio review opened for a synthetic data-centre asset in the Thames Valley.
- Five source records were checked; two hazard datasets were selected and one coarse flood layer was excluded from file closure.
- The affected-area signal intersected the asset area, but the site file lacked drainage and backup-power evidence.
- The case moved to evidence request instead of file closure.

MVP SCOPE

Review package prepared before the human decision.

Source package

Five source records checked. Two hazard datasets selected. One coarse-resolution flood source excluded from file closure.

Case context

Flood signal intersects the affected asset area. Confidence marked high for portfolio review.

Evidence request

Drainage drawings, backup generator location, and cooling continuity note requested before file closure.

PRODUCT WORKBENCH

The reviewer starts from a case that already needs action.

Thames Valley DC-01 has an active flood review, incomplete resilience evidence, and a next workflow step.

- Portfolio review opened
- Hazard signal mapped
- Evidence gap visible
- Next action: prepare review package

The screenshot displays the EDGION Professional Review Workflow interface. At the top, a progress bar shows five steps: 01 Case signal (Active), 02 Information check (Pending), 03 Review prep (Pending), 04 Review decision (Pending), and 05 Decision record (Pending). The main content area is titled 'Professional Review Workflow' and shows 'STEP 1: Review the case signal, then confirm evidence readiness.' Below this, a map of London is displayed with various hazard layers. The 'Physical-Risk Layers' section on the left includes options for Flood (UK river RP100 depth, EA Zone 3 extent), Heat (GLA heat risk), Wildfire danger (EFFIS FWI), Wind (storm footprint proxy, checked), Rain (rainfall footprint proxy), and Water stress (WRI Aqueduct). The map shows the 'Thames Valley DC-01' location. On the right, a 'WORK-UP STATUS' panel indicates 'Reviewer action required' with 5 sources selected and site-level resilience evidence incomplete. A 'REVIEW PREP' panel notes 'Why this cannot close automatically' due to external signal being market/regional, spatial layer being screening-level, and power/cooling/water evidence being incomplete.

Latest 8770 product screen: case intake with map context and workflow status.

Review package prepared: source caveats, spatial context, and evidence requests are ready for human review.

Source Suitability Agent

STATUS	Completed
OUTPUT	5 source records checked; 2 hazard datasets selected.
MISSING	None for portfolio screening.
RECOMMENDATION	Do not use coarse flood layer for file closure.

Spatial Context Agent

STATUS	Completed
OUTPUT	Flood signal intersects affected asset area.
MISSING	No further location check needed.
RECOMMENDATION	Use this location context in the review.

Resilience Agent

STATUS	Evidence required
OUTPUT	Site file incomplete.
MISSING	Drainage drawings; generator location; cooling note.
RECOMMENDATION	Request resilience evidence.

Review Prep Agent

STATUS	Ready
OUTPUT	Review package prepared.
MISSING	Reviewer evidence response.
RECOMMENDATION	Request evidence before file closure.

UIPATH ORCHESTRATION

This is a case lifecycle, not a one-off automated answer.

The agents prepare the review. UiPath keeps the case alive until evidence, reviewer action, and record are complete.

UIPATH EVIDENCE

Agents prepare one review. UiPath controls the case around it.

Studio Web / Maestro BPMN

Debug run successful

Published v1.0.1

Why not just generic automation?

- ✓ Agents answer: what did we find?
- ✓ UiPath answers: who owns this case now?
- ✓ Human review required before close
- ✓ Evidence wait states and routing
- ✓ Audit trail for the whole case

STATUS
Human-reviewed action captured

SELECTED ACTION
request_site_evidence

Review package
Review package across 5 selected sources: source suitability, spatial and temporal context, resilience gaps, caveats, and reviewer questions.

Package contents
5 sources · 6 evidence gaps · 5 reviewer questions.

Reviewer action
Request current site-level resilience evidence and refer to risk engineering if evidence remain incomplete.

Evidence requests
6 review-ready requests prepared; 1 opened: Site and asset basis

Decision record generated after the reviewer requested additional resilience evidence.

Review outcome

DECISION
Request Evidence

REASON
The work-up is complete: five source records checked, two hazard datasets selected, flood area checked against DC-01, and resilience evidence is still missing. Review closure is paused until drainage, backup power, and cooling evidence is provided.

NEXT ACTION

- Request drainage drawings
- Request backup power specification

REVIEWER
Selected next action

- Audit trail attached
- Source caveats preserved
- Workflow history recorded

07

CASE OUTCOME

The useful agent is not the one that makes the final asset decision.

It knows the source limits, finds missing evidence, asks the right human question, and leaves UiPath with a traceable record.

Built now

Case opened, review package prepared, human action captured, and decision record generated.

Production path

Portfolio review queue → UiPath Queue/API → Action Center or Action App → source connectors → auditable record store.

Team value

Helps teams prepare reviews faster, with a record they can defend.
